Thread Definition on Smooth Bolt Surface

Unscrewing

SPR Stresses (Smooth Patch Recovery)

Classical element stresses

Smoothed element stress. In addition, stress gradients on the surface are also available.

Visco-Elastic Material in Dynamics

$$E(f) = E_0 + \sum_{i=1}^n \frac{i \cdot 2\pi E_i \cdot f}{(i \cdot 2\pi \cdot f) + E_i / C_i}$$

... using Prony series

Contact status and contact forces

Normal Friction

SHAPE optimization

TRIA-to-QUAD Interpolation

Fully quadratic contact and stress evaluation

Laminate Analysis with ELT

Extended Laminate Theory takes transverse shear into account

Ply stack
E₁ = 1.10⁴, ν₁₂ = 0.4
E = 5.10⁴, ν = 0.3
G₁₂ = 3.10⁴

Optimization of ply shapes

DE 1
0°/90° dominated areas
DE 2
DE 3
DE 4
DE 5
DE 6
±45° dominated areas

Add & Replace Wizard

Linearized contact and stress evaluation

Extended Use of Third Party Software

Comparison with NAFEMS benchmark

Result	Position	NAFEMS	PERMAS	Difference
z-deflection u _z	E	-1.06	-1.067	+0.7%
Bending stress σ _x	E	683.9	682	-0.3%
Transverse shear stress σ _{xy}	D	-4.1	-4.06	-1.0%

Optimization of ply stacks

Symmetric laminate and plies for 0°, 90°, ±45°

Restriction for sum of ply thicknesses

PERMAS

Condensation → CB Model → MBS
Gen Stress → Sig(t), dSig(t)/dn → Fatigue

Re-import of MBS results for stress analysis inside PERMAS, and subsequent invoking of fatigue life analysis from within PERMAS

Extension of Standard Beam Cross Sections

... by two solid cross sections

as busy as a bee!
